4. Recovering Corrupt Volumes

Now that you have complete familiarity of the user interface of Kernel for Macintosh, you are ready to recover corrupt volumes of Macintosh. To recover volumes:

1. Launch Kernel for Macintosh. As soon the software is launched, it scans all the physical disks attached to your system and displays them.

2. Select the device from where you want to recover the corrupt volume.

3. Select the Volume Identify Options from the main window of the software either Use Partition Table or Search Partition.

   - **Use Partition Table** - This option is the default option to recover corrupt volumes.
   
   - **Search Partition** - This option will search your partition if you don't get your partition using "Use Partition Table".

4.1 Use Partition Table
To go by **Use Partition Table** option, perform the following:

1. First three steps are same as step 1, 2, 3 of Recovering Corrupt Volumes.
2. Select the **Use Partition Table** option.
3. Click **Next** button to proceed. Kernel will start mounting the volumes.

![Figure 4.2: Scanning Process](image)

4. As the scanning gets complete, the software displays the recovered files and folders of the selected device.
5. Select the files and folders which you want to save from the right pane of the window and copy using **Recover Selected** button in the tool-bar. Save at the appropriate location.

You can also right click and save all file or selected files at appropriate location.

### 4.2 Search Partition

If you don’t get your partition or you have missed the partition then you can use **Search Partition** option to search your missing partitions. To go by **Search Partition** option, perform the following:

1. First three steps are same as step 1, 2, 3 of Recovering Corrupt Volumes.

2. Select the **Search Partition** option from Volume Identify Option.

3. Edit the Start Sector and End Sector to search and click **Next** button to proceed with the next step of searching process. Then after the searching process, it will display all the partitions found during searching process.
4. Select the found partition from which you want to recover data and click **Next** button for recovery process.

5. As the scanning process gets complete, software displays the recovered files and folders of the selected partition.

6. Save the recovered data by selecting the same from the right pane of window and copy using **Recover Selected** button in the tool-bar. Save at the appropriate location.

   You can also right click and save all file or selected files at appropriate location.
5. File Search from Found Data

5.1 File Search

With thousands of files and directories to view, finding a particular file in a directory tree can be difficult. The Search option makes finding the files much easier. This option is modeled after some of the most popular Windows programs, making it very easy to use.

If you know the name or part of the name of the file(s) or folder(s), then follow this step:

- Click **Tools** menu → **Find Files** or click **Search** button from the Toolbar.
- A new window appears which asks for the string to search.

String could be *, *.TXT, AB*,.*, ABC.txt etc.

5.2 File Filters

The Filter feature allows you to filter the files you are interested in by viewing in the directory tree display. There can be a situation when the total found data contains too many file(s) but you only want to recover and see only some application specific data, like all the text file(s). In that situation consider the following:

- Click **Tools** menu → **File Filters**.

- Screen pop-ups which ask for Filter. You can add or remove the filters available accordingly.

⚠️ The software will filter only the file(s) that you want to recover and it will hide rest of the file(s).
6. Full Version
