

What's New

In Kernel for Exchange Server Recovery 19.0

This document describes the latest enhancements to Kernel for Exchange Server Recovery

Introduction

Kernel for Exchange Server is an advanced Exchange database recovery software that can recover exchange mailbox from a corrupt exchange database file.

Apart from EDB recovery, it also allows users to migrate data from Exchange, Outlook Profile, and Office 365 (Exchange Online). You can also select multiple destinations like PST file, Live Exchange, Office 365, etc.

The migration process in Kernel Exchange Server can be completed via multiple methods like copy-paste, drag-and-drop, export to PST/MSG/EML, copy all mailboxes, etc.

Latest Enhancements

Kernel for Exchange Server Recovery Version 19.0 has the following updates:

- Enhanced recovery of Exchange 2019 and 2016 mailboxes.
- Enhanced connectivity to on-premises Exchange Server.
- Fast conversion of EDB to PST without Outlook.
- Save Exchange/Office 365 mailboxes to PST with an email address or mailbox name as the name of the PST file.

These new features improve the efficiency and accuracy of EDB to PST migration.
