

What's New

In Kernel for Exchange Recovery –Version 18.2

The document provides updated information about the Kernel for Exchange Recovery tool

Introduction

Kernel for Exchange Recovery software is designed to recover all kind of Exchange data (including backup files) without any data loss. It transfers the recovered data to various destinations as per user's requirement.

The tool recovers EDB files within minutes and also includes options to move only required data. Filters like date range and item type are of great importance.

The destinations for recovered data includes Exchange, Outlook, Office 365 and Outlook profiles.

Kernel for Exchange Recovery 18.2, the updated version ensures more precise recovery & migration through added algorithms and bug fixing.

Latest Enhancements

See the latest updates that Kernel for Exchange Recovery Version 18.2 includes now:

- **Improved recovery/migration speed**
- **Easier to migrate selective data after the improvements of filters**
- **Boosted performance because of advanced algorithms**
- **Improved data security**

This version makes Exchange recovery and migration easier with the latest enhancements.
